ISAT testing by Prometric remote proctoring

Screen resolution recommendation

Verify and make sure your computer screen resolution is set to the maximum resolution which your monitor can support.

In Windows, right click on your desktop and select Display settings on the pop-up menu.

Click the Resolution dropdown box and scroll up to select the maximum resolution.

Resolution 1920 x 1080 will provide the best user experience for your testing.

Resolution 1440 x 900 is considered as the minimum requirement. If your resolution is smaller than it, a good testing experience cannot be ensured.
By 1920 x 1080 screen resolution, the question content and the options are shown side by side for easy viewing.

If screen resolution is lower than 1920 x 1080, the question content will be shown in pop-up window. For example, by the recommended minimum screen resolution 1440 x 900, the question content is shown in pop-up window on top of the options. You can still drag and move the pop-up window to avoid overlapping.

If your screen resolution is smaller than 1440 x 900, you still can test but need more pop-up window moving actions to avoid overlapping.
